

## On a conjecture related to integer-valued polynomials

by  
VICTOR J. W. GUO

### Abstract

Using the following  ${}_4F_3$  transformation formula

$$\sum_{k=0}^n \binom{-x-1}{k}^2 \binom{x}{n-k}^2 = \sum_{k=0}^n \binom{n+k}{2k} \binom{2k}{k}^2 \binom{x+k}{2k},$$

which can be proved by Zeilberger's algorithm, we confirm some special cases of a recent conjecture of Z.-W. Sun on integer-valued polynomials.

**Key Words:** Zeilberger's algorithm, Chu-Vandermonde summation, integer-valued polynomials, multi-variable Schmidt polynomials.

**2020 Mathematics Subject Classification:** Primary 33C20; Secondary 11A07, 11B65, 05A10.

## 1 Introduction

Recall that a polynomial  $P(x) \in \mathbb{Q}[x]$  is called *integer-valued*, if  $P(x) \in \mathbb{Z}$  for all  $x \in \mathbb{Z}$ . During the past few years, integer-valued polynomials have been investigated by several authors (see, for example, [3, 6, 13]). Recently, Z.-W. Sun [14, Conjectures 35(i)] proposed the following conjecture.

**Conjecture 1** (Z.-W. Sun). *Let  $l, m, n$  be positive integers and  $\varepsilon = \pm 1$ . Then the polynomial*

$$\frac{1}{n} \sum_{k=0}^{n-1} \varepsilon^k (2k+1)^{2l-1} \sum_{j=0}^k \binom{-x-1}{j}^m \binom{x}{k-j}^m$$

*is integer-valued.*

By the Chu-Vandermonde summation formula, we have

$$\sum_{j=0}^k \binom{-x-1}{j} \binom{x}{k-j} = \binom{-1}{k} = (-1)^k.$$

Thus, by [9, Lemmas 2.3 and 2.4], we see that Conjecture 1 is true for  $m = 1$ . In this note, we shall confirm Conjecture 1 for  $m = 2$ .

**Theorem 1.** *Let  $l$  and  $n$  be positive integers and  $\varepsilon = \pm 1$ . Then the polynomial*

$$\frac{1}{n} \sum_{k=0}^{n-1} \varepsilon^k (2k+1)^{2l-1} \sum_{j=0}^k \binom{-x-1}{j}^2 \binom{x}{k-j}^2 \quad (1.1)$$

*is integer-valued.*

We shall also prove the following result, which confirms the  $l = 1$  cases of [14, Conjectures 35(ii)].

**Theorem 2.** *Let  $n$  be a positive integer. Then the polynomial*

$$\frac{1}{n^2} \sum_{k=0}^{n-1} (2k+1) \sum_{j=0}^k \binom{-x-1}{j}^2 \binom{x}{k-j}^2 \quad (1.2)$$

*is integer-valued.*

## 2 Proof of Theorem 1

We first require the following  ${}_4F_3$  transformation formula.

**Lemma 1.** *Let  $n$  be a non-negative integer. Then*

$$\sum_{k=0}^n \binom{-x-1}{k}^2 \binom{x}{n-k}^2 = \sum_{k=0}^n \binom{n+k}{2k} \binom{2k}{k}^2 \binom{x+k}{2k}. \quad (2.1)$$

*Proof.* Denote the left-hand side or the right-hand side of (2.1) by  $S_n(x)$ . Applying Zeilberger's algorithm (see [1, 10]), we obtain

$$(n+2)^3 S_{n+2}(x) - (2n+3)(n^2+2x^2+3n+2x+3)S_{n+1}(x) + (3n^2+3n+1)S_n(x) = 0.$$

That is to say, both sides of (2.1) satisfy the same recurrence relation of order 2. Moreover, the two sides of (2.1) are equal for  $n = 0, 1$ . This completes the proof.  $\square$

Using Zeilberger's algorithm, Z.-W. Sun [11, Eq. (3.1)] found the following identity:

$$16^n \sum_{k=0}^n \binom{-1/2}{k}^2 \binom{-1/2}{n-k}^2 = \sum_{k=0}^n \binom{2k}{k}^3 \binom{k}{n-k} (-16)^{n-k}, \quad (2.2)$$

and he [12, Eq. (3.1)] gave the following formula:

$$64^n \sum_{k=0}^n \binom{-1/4}{k}^2 \binom{-3/4}{n-k}^2 = \sum_{k=0}^n \binom{2k}{k}^3 \binom{2n-2k}{n-k} 16^{n-k}. \quad (2.3)$$

Here we point out that, for  $x = -1/2$  and  $-3/4$ , Eq. (2.1) gives identities different from (2.2) and (2.3).

In [2], Chen and the author introduced the multi-variable Schmidt polynomials

$$S_n(x_0, \dots, x_n) = \sum_{k=0}^n \binom{n+k}{2k} \binom{2k}{k} x_k.$$

In order to prove Theorem 1, we also need the following result, which is a special case of the last congruence in [2, Section 4].

**Lemma 2.** *Let  $l$  and  $n$  be positive integers and  $\varepsilon = \pm 1$ . Then all the coefficients in*

$$\sum_{k=0}^{n-1} \varepsilon^k (2k+1)^{2l-1} S_k(x_0, \dots, x_k).$$

are multiples of  $n$ .

*Proof of Theorem 1.* For any non-negative integer  $k$ , define

$$x_k = \binom{2k}{k} \binom{x+k}{2k}.$$

Then the identity (2.1) may be rewritten as

$$\sum_{k=0}^n \binom{-x-1}{k}^2 \binom{x}{n-k}^2 = \sum_{k=0}^n \binom{n+k}{2k} \binom{2k}{k} x_k. \tag{2.4}$$

It is easy to see that  $x_0, \dots, x_n$  are all integers on condition that  $x$  is an integer. By Eq. (2.4) and Lemma 2, we see that the polynomial (1.1) is integer-valued.  $\square$

### 3 Proof of Theorem 2

We need the following result, which can be easily proved by induction on  $n$ . See also [2, Eq. (2.4)].

**Lemma 3.** *Let  $n$  and  $k$  be non-negative integers with  $k \leq n-1$ . Then*

$$\sum_{m=k}^{n-1} (2m+1) \binom{m+k}{2k} \binom{2k}{k} = n \binom{n}{k+1} \binom{n+k}{k}. \tag{3.1}$$

*Proof of Theorem 2.* Using the identities (2.1) and (3.1), we have

$$\begin{aligned} \sum_{m=0}^{n-1} (2m+1) \sum_{k=0}^m \binom{-x-1}{k}^2 \binom{x}{n-k}^2 &= \sum_{m=0}^{n-1} (2m+1) \sum_{k=0}^m \binom{n+k}{2k} \binom{2k}{k}^2 \binom{x+k}{2k} \\ &= \sum_{k=0}^{n-1} n \binom{n}{k+1} \binom{n+k}{k} \binom{2k}{k} \binom{x+k}{2k}. \end{aligned}$$

It follows that the expression (1.2) can be written as

$$\sum_{k=0}^{n-1} \frac{1}{n} \binom{n}{k+1} \binom{n+k}{k} \binom{2k}{k} \binom{x+k}{2k} = \sum_{k=0}^{n-1} \frac{1}{k+1} \binom{n-1}{k} \binom{n+k}{k} \binom{2k}{k} \binom{x+k}{2k}. \quad (3.2)$$

Since  $\frac{1}{k+1} \binom{2k}{k} = \binom{2k}{k} - \binom{2k}{k-1}$  is clearly an integer (the  $n$ -th Catalan number), we conclude that the right-hand side of (3.2) is also an integer whenever  $x$  is an integer. This proves the theorem.  $\square$

## 4 Concluding remarks

Z.-W. Sun [14, Conjecture 35(ii)] conjectured that, for all positive integers  $l$  and  $n$ , the polynomial

$$\frac{(2l-1)!!}{n^2} \sum_{k=0}^{n-1} (2k+1)^{2l-1} \sum_{j=0}^k \binom{-x-1}{j}^2 \binom{x}{k-j}^2$$

is integer-valued. Here  $(2l-1)!! = (2l-1)(2l-3)\cdots 3 \cdot 1$ .

We believe that the following (stronger) result is true.

**Conjecture 2.** *Let  $l$  and  $n$  be positive integers and  $k$  a non-negative integer with  $k \leq n-1$ . Then*

$$(2l-1)!! \sum_{m=k}^{n-1} (2m+1)^{2l-1} \binom{m+k}{2k} \binom{2k}{k}^2 \equiv 0 \pmod{n^2}. \quad (4.1)$$

Our proof of Theorem 2 implies that the above conjecture is true for  $l = 1$ . In view of (2.1), Sun's conjecture follows from (4.1) too.

Recently,  $q$ -analogues of congruences have been studied by many authors. See [4, 5, 7, 8, 15] and references therein. For  $l = 1$ , we have a  $q$ -analogue of (4.1) as follows:

$$\sum_{m=k}^{n-1} [2m+1] \begin{bmatrix} m+k \\ 2k \end{bmatrix} \begin{bmatrix} 2k \\ k \end{bmatrix}^2 q^{-(k+1)m} \equiv 0 \pmod{[n]^2}, \quad (4.2)$$

where  $[n] = 1 + q + \cdots + q^{n-1}$  is the  $q$ -integer and  $\begin{bmatrix} n \\ k \end{bmatrix} = \prod_{j=1}^k (1 - q^{n-k+j}) / (1 - q^j)$  denotes the  $q$ -binomial coefficient. The proof of (4.2) is similar to that of Theorem 2. However, we cannot find any  $q$ -analogue of (4.1) for  $l > 1$ .
